

# Campus Conquest Zwischenpräsentation

Gruppe 8

Michael Sailer, Paul Preißner, Jonas Mayer, Benedict Drechsler, Jean-Paul Vieira, Julian Frattini

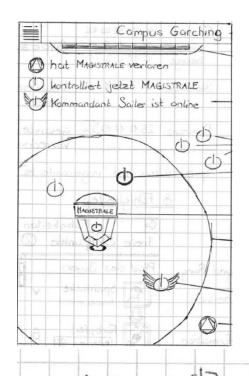

[IN 0036] Praktikum Social Gaming

## Übersicht

- Gamekonzept Idee, Inspiration und Hintergrund des Spiels
- Pipeline Arbeitsweise und Teamaufstellung
- Projektplan Meilensteine, Zeitplan und Entwicklungsoptionen
- Clientstruktur Aufgabenbereiche und Layout des Clients
- Long-Term-Social-Context Ideen zur Verbesserung des Long-Term Social-Context

## Gamekonzept

**Inspiration - Problem - Lösung** 

#### Inspiration:

Bekanntes Konzept aus RTS und FPS Neu:

location-based, mobile und soziale Aspekte

#### Problem:

Methode zum Neutralisieren von Gegnern nicht trivial

### Lösung:

Zeichnen von Polygonen aus verbündeten Spielern

## Gamekonzept

Warum es sich gegen die anderen Konzepte durchsetzte

#### Vorteile in der Entwicklung:

- Überschaubare Menge an Art-Assets
- Map-Design und Design von Fraktionen trivial

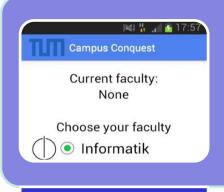

#### Playability:

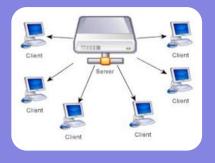

- Im Grunde einfach verständliche Spielmechanik
- Gruppeneinteilung fest durch äußere Gegebenheiten
- Langzeitspielmotivation gegeben durch "Rivalität der Fakultäten"

                users/:facebookID/getFaculty controllers.MyApplication.getFaculty(facebookID: String)
                        returns the players faculty see getAllFaculties
                Parameters:
                        facebookID: the users facebookID
                Returns:
                        Success:
                                a JSON Object
                                                id: Integer
                                                name: String
                                                description: String
                                                 imageURL: String
                        Failure:
                                JSON FailureObject
                                -110: facebookID missing
                                -111: facebookID not found, please register user first.
                                -112: user isn't member of a faculty.
        getFacultyStats
                /game/getPlayerCount controllers.MyApplication.getPlayerCount()
                        Description:
                                returns a data structure containing all registered users organized by their faculty.
                        Parameters: none
                        Returns:
                                Success:
                                        a JSON Object
                                                playerCount: PlayerCount
                                                PlayerCount:
                                                         faculties: Faculty[]
                                                Faculty:
                                                         id: Integer
                                                        name: String
                                                        playerCount: Integer
                                                         players: Player[]
                                                         name: String
                                                         facebookId: String
                                Failure:
```

## Dokumentation auf Server-Seite

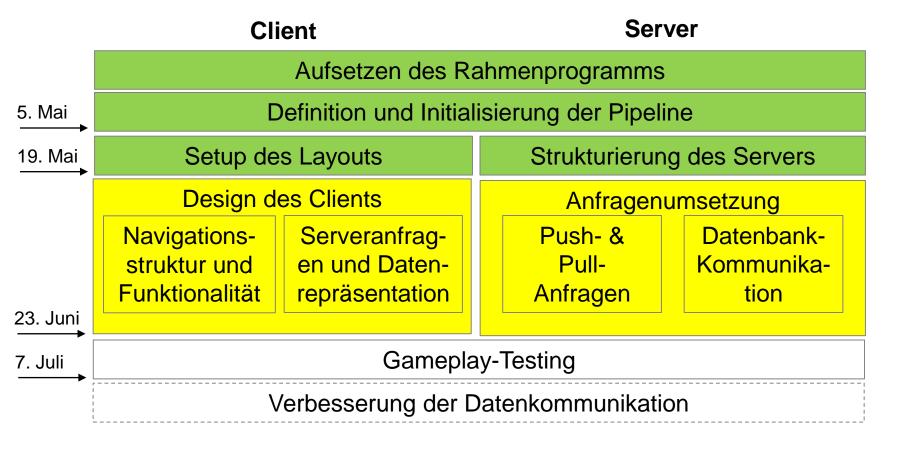

## Neue Anforderungen

Datei Bearbeiten Format Ansicht ?
For the fragment "Team Scoreboard" we need a Http get() method. It should return all values that are needed to fill the Team Scoreboard fragment:
-getTeamScoreBoard (bzw getFacultyStats):
                  returns:
                           Success:
                                    a JSON Object:
faculties: Faculty[]
                                              Faculty:
                                                       id:Integer
score:integer
                                                       players_registered: integer
                                                       players_active: integer
players_dead: integer
                                              topPlayers: Players[10]
                                                       facebookID:???
                                                       name:String
For the "Statistics" Fragment we need a Http get() method. It should return all
values that are needed to fill the Statistics fragment:
-getUserStats:
                  returns:
                           Success:
                                     a JSON Object:
                                              playtime: Playtime:
                                                                          hours:integer
                                                                          minutes:integer
                                              score:integer
                                              kills:integer //number of kills the user has assisted at
                                              deaths:integer
                                              captures:integer //number of flag captures the user has assisted at
                                              faculty:integer
                                              polygons:integer //number of polygons the user has drawn
```

# Projektplan

### Clientstruktur

#### Tasks/Upload:

- Constantly updated sensor data + player moves/polygons
  - (rarely) new user data

#### The Interface

- Three main Views (Map, Team, Player)
- Switch between Views through dropdown menu (Navigation Drawer use planned)

#### The Thin Client and how it works

- Login through Facebook API at startup
- Load straight into the Map View
- . Upon switching to a different View  $\rightarrow$  server request
- Frequently trade user data with the server

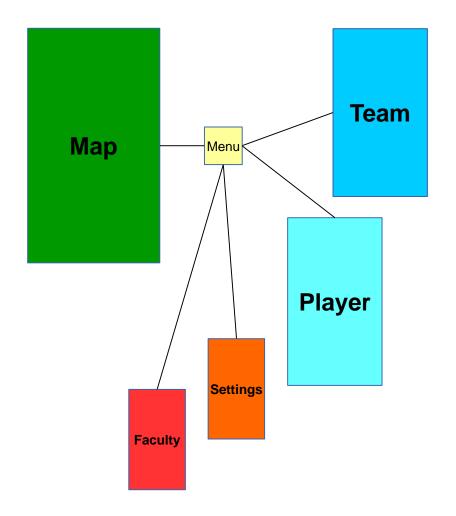

#### Tasks/Download:

- Own user data and statistics
  - · Other players' data
  - Team statistics

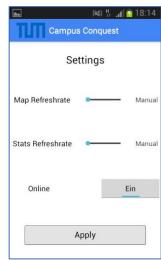

#### Vision (layout)

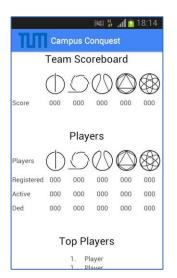

- Modern design
- Minimal latency
- Fluid navigation

# Long-Term-Social-Context

- Verbesserung des Long-Term-Social-Context durch ein Hierarchie-System (vgl. Gilden)
- Untergruppierungen innerhalb der Fakultäten
- Interaktion via Foren, Umfragen, Events, etc.
- Mitglieder-Ranglisten zur Übersicht von Aktivität
- Wettbewerb zwischen den Gruppierungen als Ansporn zum Einsatz für die Fakultät

# Vielen Dank Für ihre Aufmerksamkeit
